

Morphis Documentation

Welcome to documentation site for Morphis products

The Morphis modernization process features a proprietary toolset that deals with multiple legacy languages and enables agile development, system discovery, code assessment, governance, remediation and software modernization to a Java or .NET environment.

Analyze

- Analyze your applications and generate reports that inform your decisions
- Make the right diagnosis on the complexity of your applications
- Create dashboards with the most important analytic KPI's
- Make solid decisions when choosing the next step (modernize or rewrite)

[Read more](#)

Transform

- Transform your applications by refactoring or migrating to the same or new technologies
- By refactoring or migrating your code you are ensuring that it is optimized
- By migrating your software you can modernize it, choosing the most up-to-date technologies as targets.

[Read more](#)

Develop

- Enable rapid development
- Platform independence
- Proven technologies and frameworks that optimize your workflow
- Choose the most commonly used technologies and embrace the future by keeping your applications modern
